Sorting and Processing Scrap Material

Sorting and processing scrap material is a crucial step in the trading process. It involves several steps to ensure that the material is properly sorted and prepared for resale.

Sorting

The first step in sorting scrap material is to separate it by type. This can include separating ferrous and non-ferrous metals, as well as separating different types of plastics, paper, and other materials. Once the material is separated, it is often further sorted by grade or quality.

Processing

Once the material is sorted, it is processed to prepare it for resale. This can include cleaning, shredding, and melting down metals to create new products. Plastics and other materials may be ground down and turned into pellets that can be used in manufacturing.

Scrap Material Products

Sorting and Processing

Proper sorting and processing of scrap material is crucial to ensure it is properly prepared for resale. This includes separating different types of scrap, such as MS scrap, stainless steel scrap, and non-ferrous scrap, and ensuring they are clean and free of contaminants.
